For example, Quartz is a 7 on the hardness scale so it would be able to scratch any mineral that is a 6, 5, 4, 3, 2, 1. There are also some common materials used to test hardness. A fingernail is a 2.5, a penny is a 3.5, and a steel nail is 6.5. We will be using these items to test the hardness of our minerals today.

Fifth grade Lesson Properties of Minerals | BetterLesson

Mineral - Mineral - Classification of minerals: Since the middle of the 19th century, minerals have been classified on the basis of their chemical composition. Under this scheme, they are divided into classes according to their dominant anion or anionic group (e.g., halides, oxides, and sulfides). Several reasons justify use of this criterion as the distinguishing factor at the highest level ...
